

And the **performance-history drawer** (row click) — the lightweight drill-down you asked to keep:

How RPR earns its own screen:

- **Period model** is Week / **Month** / Custom with a **"vs Last Month"** toggle — every metric carries a ▲▼ delta (green up / red down / "—" flat), and the summary strip shows org-level movement. That's the performance read RDR doesn't have.

- **Seven columns** per spec: accuracy, discipline, utilization hrs, the **billable/non-billable split bar**, and **available capacity** — with the same four-band chips + "Not Available" reused from RDR.
- **Ranking** as a sort mode (Top by Billable %, shown) — folds RPR018/019 in without a separate leaderboard screen.
- **Exceptions handled:** Sneha on full-period leave → metrics "Not Available", split bar 100% grey, capacity "—" (RPR-BR + exception table).
- **Drawer** = the lightweight drill-down: this-month cards, a 6-month trend that surfaces *why* someone's flagged (Priya's discipline sliding into red), and remaining capacity — read-only, explicitly pointing edits back to Planner/Confirmation.
