

And the **project execution drawer** (row click) — Project Detail with the resource roster inline, which is where PER022 earns its keep:

How PER completes the family:

- **Row = project.** The two computed pills (Accuracy, Discipline) and the billable split carry over from RPR unchanged, so the three reports feel like one system. **Resources** is a plain count (PER016/BR005), and **Health** sits apart as a traffic-light —

Green/Amber/Red dot + text, read straight from Project Portfolio (BR006), never a computed band.

- **Attention as sort.** "Sort: Attention first" floats Amber/Red + sagging accuracy to the top (PER020) — no separate mode, just reorders what's already there. Health filter + Status filter cover PER008/009.
- **Exceptions all land:** Nova (Critical, real attention row), Orion (On Hold — metrics shown, status + health retained per the exception table), Internal R&D (0% billable / 100% non-billable), Lumen (unstaffed → Resources 0, metrics "Not Available", grey bar).
- **Drawer** is richer than RPR's by design: this-month cards, the **contributing-resource roster** with each person's allocation + discipline (PER022 — the roster is the whole point), and an execution-history trend (PER023). Read-only, with Health flagged as portfolio-derived.
