

FRD — Leave Utility in Resource Planner

Location

Add a “**Leaves**” button in the **Resource Planner** header row, immediately before “**+ Allocate**”.

This is a lightweight operational utility only.

It is **not a Leave Management System / HRMS module**.

1. Shell / UI

Clicking **Leaves** should open one **wide modal**, similar to the existing **Map Employees** utility.

Do **not** use a drawer.

Inside the same modal:

- Show a compact **Add Leave inline strip** above the grid.
- Show the Leave history/grid below.
- Row-level actions should support:
 - **Edit Reason**
 - **Cancel Leave**

No separate page is required.

2. View Scope

User can view leave records for:

- Self
- Direct reportees
- Indirect reportees

However:

Enter / Edit / Cancel

Allowed only for **reportees**.

The user must **never enter, edit, or cancel their own leave**.

3. Add Leave

The inline Add Leave strip should contain:

Field	Rule
Resource	Mandatory; only direct/indirect reportees
Leave Date	Mandatory; Today or Future only
Leave Type	Planned / Unplanned
Reason	Mandatory (max text entry length is 30 characters)

Only **Full Day Leave** is supported.

RO manually selects **Planned / Unplanned**.

Do not derive Leave Type automatically from the date.

4. Date Rules

Leave entry is allowed only for:

- Today
- Future dates

Not Allowed

- No backdated leave entry.
- If the Resource has already pressed **Day Start** for today, leave entry must be blocked.

Show a clear validation message such as:

“Leave cannot be entered because Day Start is already recorded for this resource.”

5. Negative / Zero Leave Logic

At the moment leave is created:

Negative Leave

If any work is already planned/allocated to that Resource on the selected leave date:

Leave Classification = Negative

Also capture:

Impacted Planned Hrs = Total planner planned hours for that Resource on that date

Example:

Project A = 3 hrs

Project B = 4 hrs

Impacted Planned Hrs = 7 hrs

This is a historical snapshot and must **never be recalculated later**.

Even if the RO later modifies or reallocates that work, the original impacted hours remain unchanged.

Zero Leave

If no work is planned on that date:

Leave Classification = Zero

A Planned or Unplanned Leave can both be Negative or Zero.

6. Work Allocation Control

Once an **Active Leave** exists for a Resource + Date:

- Resource Planner must block new work allocation for that Resource on that date.
- Show a clear message that the Resource is on Leave.
- Allocation becomes possible only after the leave is cancelled.

7. Planner Visual

In Resource Planner grid cells, show a simple:

Leave

marker for an active leave date. (In week view this marker is not required until full week resource is on leave)

Keep the planner visual minimal.

Once leave is cancelled:

- Remove the Leave marker immediately.
- The date becomes available for allocation again.

8. Leave Grid

The modal grid should show:

Column

Leave Date

Resource

Department

Leave Type

Negative / Zero

Reason

Entered By

Entered On

Impacted Planned Hrs

Status

Actions

Status

- Active
- Cancelled

Actions

For reportees only:

- Edit Reason
- Cancel

For self:

- View only

9. Edit / Cancel Rules

Edit

Only **Reason** can be edited.

Do not allow changing anything else.

Cancel

Leave cannot be deleted.

RO may **Cancel Leave**.

Cancelled leave:

- Remains in history/grid
- Does not block work allocation
- Does not show Leave marker in Resource Planner
- Must not be treated as an active leave

10. Basic Filters

Keep filters lean:

- Date
- Department
- Resource
- Leave Type
- Negative / Zero
- Status

11. Access

Do not introduce any new Access Rights menu or permission configuration.

Access should flow through:

Resource Planner → Leaves

Use existing reporting hierarchy logic.

12. Out of Scope

Do not add:

- Leave balance
- Leave approval workflow
- Half-day leave
- HR leave categories
- Leave accrual
- Carry-forward
- Payroll integration
- Backdated leave
- Employee self-entry
- Leave request workflow
- Automatic work shifting/reallocation

Core Intent

This utility should answer only two operational questions:

“Is this resource available for planned work on this date?”

And **“Did this leave disrupt already-planned work?”**
